3. Why do you think it is important to quantify and communicated uncertainty in forest and land monitoring?

- To come up with robust policies while minimizing errors associated with uncertainties in data.
- Donors require a good understanding of the accuracy associated with reporting of emissions and emission reductions
- To identify the areas and factors what creates uncertainty
- Interperability
- Policy formulation
- As DSS
- To understand the confident level of the report
- To know how confident we can be on outcomes, results
- Trust
- Communicate accurate values
- Important for science.
- Maybe critical for decision makers.
- If finance is involved, it is important to be accurate
- It helps to qualify what you have, changes
- To avoid "hot air"
- Critical for data accuracy and transparency
- To bring predictions and model outputs close to reality
- Honesty
- To maintain confidence of the estimates
- Cmnucc reports and carb9n market
- To determine how accurate estimates are for transparency
- For reliability. Important for transparency because we don’t know the “truth” but rather a range.
- Transparency
- Because uncertainties are typically high
- Determine how the results are closer to the truth
- Promote high integrity pathways for transacting ERs
- Because estimates are UNCERTAIN
- Transparency
- Better decision-making
- translating into common language so policy and decision makers use it (well)
- Reliability of data
- Integrity
- Transparency
- To understand data limits
- Reliability
- To improve estimates
- Climate finance
- To evaluate uncertainty
- Interpretability
- Reliability
- Trust
